

Cliff Green Studio
Prehistoric and modern wildlife sculpture

Cliff Green Studio sculptures are sold four different ways.

1. A kit is an unfinished primed resin sculpture. Hobbyists who prefer to paint their own models commonly purchase this type of sculpture.
2. A finished open addition resin cast sculpture is hand painted, and comes with name plaques, attached to a wood base.
3. Fiberglass is extremely strong, and different types can be used for indoor or outdoor displays. I incorporate this medium for my larger pieces only.
4. All of my sculptures are available in limited addition bronze. The number of runs varies with each sculpture. Bronzes come with metal name plaques, a hard wood or marble base, and a hand signed certificate of authentication. Bronze is considered the fine art aspect of sculpture, and has a depth, beauty and permanence unattainable in other mediums.

Most of my studio's revenue is based on private, film, museum, or government commissions. If you or your institution is searching for professional paleontological related sculpture, please call or email for free quotes.

1/35th scale

A. **Triceratops horridus** 1/35th scale resin \$ 75.00 kit, painted and finished with plaque and wooden base, \$ 200.00 + \$ 10.00 S/H. Limited edition bronzes are \$ 1,100.00.

Triceratops was giant Hell Creek (Latest Cretaceous) Formation Chasmosaurine horned dinosaur. This sculpture is based on a huge fossil skull at BYU's Earth Science Museum. The skull is over ten feet long, and may push Triceratops into being the absolute largest ceratopsian. Triceratops lived at the very end of the Age of Dinosaurs and was a contemporary of **Tyrannosaurus Rex**. This sculpture has won Best of show, professional, Creative Arts, 2002 Utah State Fair, painted resin, and 2nd place Fine Art Bronze professional, 2003 Utah State Fair.

B. **Shonisaurus popularis** / Nevada 1/35th scale. Kit: \$ 90.00. Price for painted resin \$ 225.00 + 10.00 S/H. Limited edition bronze \$ 1,500.00. Length 15 Inches, Height with base 10 Inches.

This Triassic ichthyosaur is now considered to be a primitive shastasaur. Many individual shonisaurids of various sizes were found together in Mid Triassic marine outcrops, near Berlin, Nevada. *Shonisaurus popularis* is the Official State Fossil of Nevada.

C. [Shonisaurus sikanniensis](#) / British Columbia 1/35th scale. Kit: \$ 150.00. Price for painted with base resin \$ 350.00 + \$20.00 S/H. Limited edition bronze \$2,500.00. Length 24 Inches, Height 14 Inches.

S. sikanniensis was twice the mass of its American cousin, *S. popularis*. Its remains were first discovered by backwoods hikers in British Columbia, Canada in the mid 1990's. *S. sikanniensis*, at 75 feet, was the size of a modern baleen whale. There is fossil evidence that this fish lizard may have achieved an even greater size. *S. sikanniensis* was first described in The Journal of Vertebrate Paleontology, Volume 24, December 2004.

D. **Mapusaurus rosei** 1/35th scale. Kit: \$ 85.00. Painted resin, \$ 200.00. Bronze, \$ 1,000.00. 14 inches long.

This gigantic charcharodontosaurid was a close relative of the later Giganotosaurus carolinii, and was found in Argentina in a mass grave site. There were 15 individual skeletons, from 20 foot long juveniles to 45 plus foot long adults, found together, with no fossils of any other type of animal. This discovery suggests evidence that these theropods hunted in packs, and probably had enough combined fire power to bring down sauropods the size of Blue Whales. Its skull was slightly larger than Giganotosaurus, making it the largest theropod known to science. (there is some debate about Spinosaurus's alleged monolithic size.)

E. **Prognathodon currii** / Israel 1/35th scale. Kit: \$ 75.00. Painted resin, \$ 200.00, Bronze \$1,100.00.

Prognathodon was a gigantic blunt skulled mosasaur. It was named in honor of Dr. Phil Currie, the famous dinosaur paleontologist. This Prognathodon's only remains were found in Israel, and include a complete five foot crushed skull and several neck vertebra. Its total body length is unknown, but conservatively was over 45 feet. **Prognathodon currii** was first described in The Journal of Vertebrate Paleontology, volume 22, Number 3, September, 2002. This sculpture comes in one piece, with a separate base in the shape of the modern state of Israel.

The Museum Collection

A. **Gastonia burgei** (In honor of Gaston) 1/10th scale. Kit \$ 225.00. Painted resin with plaques and wood base: \$ 500.00. Limited edition bronze \$ 2,500.00.

Gastonia was a medium sized armored dinosaur. It was found in the early 1990's in Eastern Utah, and was very similar to its polycanthid relatives found in Great Britain in the 19th century. Many **Gastonia** fossil remains have been unearthed in the past ten years by various museum institutions. We have a good record of Small juveniles up to twenty foot adults. This

sculpture was rendered under the supervision of Dr. James Kirkland, Utah State Paleontologist, who described and named it, and Robert Gaston, who discovered it, and it was named in honor of.

B. **Animantarx ramaljonesi** (Living fort) 1/10th scale. Kit \$ 125.00. Painted resin with plaques and wood base: \$ 250.00. Limited edition bronze \$ 1,200.00.

Animantarx was small for a armored dinosaur, only about ten feet long, or the size of a medium cow. It lived during the Early Cretaceous, 110 ten million years ago. **Animantarx ramaljonesi** (Living fortress) was discovered in a remote area of Emery County, Utah by a retired Utah radiological technician named Ramal Jones in 1994. Mr. Jones found the fossil remains of **Animantarx** using a mobile radiation detector that he designed and built. The device could pick out the slight radiation emissions from fossilized bone, while the fossil material was still buried in the ground. **Animantarx** is the first dinosaur discovered solely by technology. Many additional fossils have since been found with this device. Because of his efforts, **Animantarx** was named in Ramal Jones's honor. This sculpture represents the latest information on the appearance of this amazing dinosaur, and won Best of show, creative Arts, at the 2004 Utah State Fair.

C. **Eolambia caroljonesi** (first Lambeosaur) 1/10th scale.28 inches long. Kit \$ 260.00. Painted resin with plaques and wood base: \$ 600.00. Limited edition bronze \$ 2,900.00.

Eolambia was a primitive duck billed dinosaur. It still retained some physical traits of the iguanodonts, its direct ancestors. **Eolambia** fossil remains were first found in Eastern Utah, at the The Carol Site, a Early Cretaceous Cedar Mountain Formation locality. It was found along side **Animantarx** , and is named in honor of Raymal Jones's wife Carol.

D. **Dilophosaurus wetherilli** (double crested reptile) 1/10th scale . 20 inches long. Kit \$ 165.00. Painted resin with plaques and wood base: \$ 350.00. Limited edition bronze \$2,500.00. It comes with a Lake Dixie ceolocanth fish base.

This Early Jurassic crested theropod, at 18 feet in length, was the largest carnivorous dinosaur of it's time. **Dilophosaurus** remains have been found in Arizona and Utah. It may have hunted primitive sauropods and giant ceolocanth fish along the shores of ancient Lake Dixie, in Southwest Utah, 200 million Years ago. This sculpture is a maquette for a full sized 18 foot long bronze monument that will be placed in front of the Saint George Dinosaur Discovery Track site at Johnson Farm Museum, in Utah. This commission is currently in production.

E. **Brontotherium hatcheri** (Thunder Beast) 1/10th scale . 15 inches long. Kit \$ 225.00. Painted resin with plaques and wood base: \$ 500.00. Limited edition bronze \$ 2,900.00.

Brontotherium was the largest of the Titanotheres, a group of uneven toed ungulates that roamed the American prairies and badlands in the Ogolecene period, 30 million years ago.

This sculpture is the maquette for a life sized bronze for the Badlands National Park in South Dakota. The project was eventually cancelled by new BNP administration.

F. **Allosaurus fragilis** (Other reptile) 1/8th scale . 46 inches long. Kit \$ 350.00. Painted resin with plaques and wood base: \$ 1000.00. Limited edition bronze \$ 3,900.00.

Allosaurus was a large theropod dinosaur that grew to over thirty feet in length and weighed over two tons. It's fossil remains have been discovered in the Late Jurassic Morrison Formation of the Western United States, including Wyoming, Colorado, Montana and Utah. Because Allosaurus fossilized bones have been found in great abundance at a site in Eastern Utah called the Cleveland / Loyd, it was made the Utah State Fossil.

G. **Utahraptor ostrommaysorum** (Utah thief) 1/8th scale . 21 inches long. \$ 225.00. Painted resin with plaques and wood base: \$ 500.00. Limited edition bronze \$ 2,600.00.

Utahraptor was first discovered in 1992 in the same quarry, the Yellow Cat, as **Gastonia** . It was the largest member of the dromaeosaur or 'raptor dinosaur family. It had more robust features than its smaller cousins, and may have hunted by ambush. When first discovered, **Utahraptor** was a sensational find. At that time, Steven Spielberg was wrapping up production on the first Jurassic Park Movie. Spielberg felt that the velociraptors from Micheal Chritchen's book, at six feet long, were too small to be scary on the big screen, so he swapped the sizes of the movie's Dilophosaurus with those of the 'raptors. The velociraptors were now a frightening twenty feet in length. There was only one problem; there were no known species of 'raptors that were even close to that size. As the movie moved forward to release, Paleontologists found Utahraptor. This amazing coincidence caused an international media blitz, and gave a fortune of free advertising to not only Jurassic Park , but to the paleontologists in Eastern Utah as well. There was even some initial talk of originally naming Utahraptor " Spielbergraptor ", but that obviously didn't take place.

Life size Sculptures

1. **Eudimorphodon ranzii**. 42 inch wing span.
2. **Preondactylus buffarinii**. 18 inch wingspan.
3. [Batrachognathus](#) *volans*. 20 inch wing span.
4. **Pterodactylus kochi**. 20 inch wing span.
5. [Peteinosaurus](#) *zambellii*. 24 inch wing span.
6. **Scaphognathus crassirostris**. 42 inch wing span.
7. **Dorygnathus banthensis**. 42 inch wing span.
8. [Germanodactylus](#) *ramphastinus* . 43 inch wing span.

The Pterosaur models are sold in many types of sets. Please call for prices. Shipping and handling are extra.

9. **Pteranodon** *ingens*. 23 feet across, \$26,000.00. This model was sculpted around the skeletal cast of real pteranodon fossil bones. It is an extremely accurate replica of this late cretaceous giant pterosaur. **Pteranodon** *ingens* can also be constructed in different poses. Shipping and handling are extra.

10. **Hagryphus** *giganteus*. Nine feet long, seven feet tall. It was found in the Grand Staircase-Escalante National Monument in south central Utah in 2002. Hagryphus 's only known fossil remains are of a hand and foot. The rest of the sculptural reconstruction is based on a closely related and still unpublished skeleton from the late Cretaceous of Wyoming. Hagryphus was a giant Oviraptorid, the largest known species in a group of feathered theropod dinosaurs that were closely related to the dromaeosaurids, or 'raptors.

\$ 38,000.00.
